Prevalence is the proportion of individuals in a population which has a disease or condition at a particular time (be it a point in time or time period).

is calculated by assuming that every country and region has the same age profile that is identical to the age profile of the world population. Comparative prevalence should be used for comparing countries and regions, and should not be used for assessing the true proportion of people who have diabetes within a country or region.

Comparative prevalence National or regional

prevalence indicates the actual percentage of each country's or region's population that has diabetes. It is appropriate for assessing the burden of diabetes for each country or region, but not comparing between countries or regions with different age structures.

All reported figures refer to the adult population aged 20-79.
